

Muslim Wellness App — MVP 1 Scope

Sep 23, 2026 · @Junaid

Product overview

A mobile wellness app built specifically for Muslims, combining daily worship tools with mood-based Quran listening and reflection.

- **Platform:** iOS and Android mobile app.
- **Target user:** Practising Muslims who want prayer tools and emotional support rooted in the Quran.
- **Differentiator:** A user shares how they feel, and the app plays authentic Quranic verses matched to that emotion.
- **Core principle:** Every religious word shown or played comes from the Quran API, unchanged. The app never generates, paraphrases or explains verses with AI.

MVP 1 features

MVP 1 ships six features: prayer times, prayer notifications, qibla, mood-based Quran sessions, tasbih counter and reflection journal.

Feature	What it does	Key requirements	Tier
Prayer times	Shows the five daily prayer times for the user's location	Auto location with manual city override; calculation method (MWL, Umm al-Qura, ISNA, Egyptian, etc.); Asr setting (Hanafi or standard); high-latitude rules	Free
Prayer notifications	Alerts the user at each prayer time	Per-prayer choice of silent, notification or full adhan; optional pre-prayer reminder; optional "did you pray?" check-in	Free
Qibla	Points toward the Kaaba	Compass using device sensors; calibration prompt	Free

Feature	What it does	Key requirements	Tier
Shama sessions (mood-based Quran)	Plays verses matched to the user's emotion	Chat or emotion chips; session length recommendation (5, 10, 15, 30 min); Arabic text, translation and recitation from the Quran API; "comfort me" or "remind me" choice	Limited free, unlimited premium
Tasbih counter	Counts dhikr	Defaults: SubhanAllah 33, Alhamdulillah 33, Allahu Akbar 34; custom dhikr with target counts; haptics; daily history	Free, custom lists premium
Reflection journal	Captures a short reflection after each session	Optional post-session prompt; mood after; rotating prompt; auto-linked verses; chronological list	Free, mood insights premium

Emotion categories (initial set)

Sadness, anxiety, anger, loneliness, gratitude, hope, humility, arrogance and greed. Each maps to a scholar-reviewed set of verses, tagged as comfort, gentle reminder or warning.

Authenticity and content architecture

AI helps curate, humans approve, and the app only ever serves approved verses from the Quran API.

```

flowchart LR
    A[AI semantic search<br/>proposes candidates] --> B[Scholar review<br/>approve and tag]
    B --> C[Approved verse library<br/>app database]
    D[User mood check-in] --> E[AI classifies mood<br/>into fixed category]
    E --> C
    C --> F[Quran API<br/>text, translation, audio]
    F --> G[Session plays]
```

The top path runs once, offline, before launch. The bottom path runs every time a user starts a session.

- **AI's only runtime job:** classify the user's words into one fixed emotion category. It never writes, paraphrases or explains religious content.
- **Why not keyword search at runtime:** keywords miss context. A search for "rejoice" returns 28:76, a rebuke of Qarun's exultation, which would feel like a scolding to a happy user.
- **Verse tags:** each approved verse is tagged comfort, gentle reminder or warning, which powers the "comfort me" or "remind me" choice.
- **Sources page:** the app credits the translator, reciter and review process on a visible "Our sources" screen.

Onboarding

Onboarding takes five screens and ends on the home screen with prayer times already working.

1. **Welcome:** one-line value statement.
2. **Location:** permission request explaining why it is needed; manual city fallback.
3. **Prayer settings:** calculation method auto-suggested by country; Asr setting.
4. **Notifications:** which prayers to alert for; adhan or silent.
5. **Language and audio:** app language (English or Arabic), translation and preferred reciter.

No account is required in MVP 1. The user lands on home with an optional "How are you feeling today?" card.

Core user flows

The home screen links to every MVP feature within one tap.

Home screen: next prayer countdown, today's times, mood check-in card, tasbih shortcut, qibla shortcut.

Mood session flow

flowchart TD

```

A[How are you feeling?] --> B[Chat or emotion chips]
B --> C{Safety check}
C -->|Risk detected| D[Support resources<br/>and helplines]
C -->|OK| E[Comfort me or remind me]
E --> F[How much time do you have?]
F --> G[Recommended session length]
G --> H[Playback: Arabic,<br/>translation, audio]
H --> I[Reflection prompt<br/>optional]
I --> J[Saved to journal]

```

The user can skip the reflection prompt at any point; the session still counts.

Tasbih flow

Pick a dhikr (default or custom) → tap to count with haptics → vibration at the target → next dhikr or finish → saved to daily history.

Journal flow

Journal tab → chronological list showing date, mood before → after and the first line → tap to open the entry and replay its verses.

Monetization

Worship essentials stay free forever; premium unlocks depth and personalisation.

Free	Premium
Prayer times, adhan and notifications	Unlimited mood sessions
Qibla	Multiple reciters and offline audio
Default tasbih	Custom tasbih lists and streaks
Mood sessions, 3 per week	Mood insights across journal entries
Writing journal entries	Curated multi-day programs (e.g. 7 days through grief)

- **Plans:** monthly, yearly (discounted) and lifetime.
- **Regional pricing:** lower prices for markets such as Pakistan, Indonesia and Egypt.
- **Family plan:** deferred to a later release.

- **No ads:** positioned alongside privacy as a trust feature.

Privacy and safety

The most sensitive data (location, mood and journal entries) stays on the device in MVP 1.

- **Location:** used on-device to calculate prayer times; never sold or shared.
- **Journal:** stored locally, encrypted; cloud backup is a later opt-in.
- **No AI on journal text:** entries are never interpreted or answered by AI.
- **Crisis detection:** mood check-ins and journal entries that suggest self-harm trigger a caring response with local helplines, instead of a session.
- **Mood classification:** chips are handled on-device; free text goes to a cloud AI model that returns only a category label, with no identifiers and no retention.

Out of scope for MVP 1

These features are deferred to later releases.

- Ramadan mode: suhoor and iftar times, fasting tracker.
- Prayer tracker, including missed prayers and qada.
- Hijri calendar and Islamic event reminders.
- Duas from authenticated hadith (e.g. Hisnul Muslim), clearly labelled with sources.
- Journal search, filters and cloud backup.
- Accounts and cross-device sync.
- Family plan.
- Languages beyond English and Arabic.

Decisions and open questions

All MVP 1 scope decisions are settled; one follow-up remains for the scholar.

Question	Decision
Quran text and translations	fawazahmed0 Quran API : free, no rate limits, 440+ translations. Text only, no audio.
Recitation audio	UmmahAPI : 12 reciters, per-ayah MP3 audio. Free up to 100 requests per minute without a key; register for a free key for higher limits.

Question	Decision
Default reciter	Mishary Alafasy, with others (e.g. Abdul Basit, Al-Sudais) selectable
Arabic edition	Uthmani script, Hafs narration
English edition	Sahih International
Verse library review	A qualified scholar
Mood classification	Emotion chips on-device; free text sent to a cloud AI model that returns only a category label, with no identifiers or retention
Free sessions	3 per week
Languages	English and Arabic only
Family plan	Later release
Session name	Shama

- ☐ Scholar to confirm the Arabic and English editions before the verse library is built.

Because the approved verse library is small, cache its text and audio on the device. This keeps sessions working offline and stays well within API rate limits.
